INTRO

With an expertise spanning over seven years in the realm of software development and maintenance, my proficiency extends across a diverse spectrum of platforms, encompassing microcontrollers, single-board computers, personal computing devices, as well as cloud-based infrastructure. My involvement has been comprehensive, engaging in every stage of the software development lifecycle for numerous intricate projects.

PRIOR EDUCATION

December 2022

Bachelor of Science in Computer Science

Texas State University

San Marcos, TX

Cumulative GPA: 3.51/4.0

SKILLS

PROFESSIONAL EXPERIENCE

July 2025 – October 2025

System Operator

Symbotic, Inc. - New Braunfels, TX

- Established daily operational goals and how to achieve them via detailed plans (documented and distributed using Microsoft SharePoint and Microsoft OneNote) that were formulated in collaboration with my corporate superiors and representatives of the customer (e.g., the Senior Automation General Manager working for Symbotic and the Floor Operations Lead working for Walmart)
- Monitored and maintained operation of a semi-autonomous fleet of robotic systems (composed of approximately 800 automata colloquially referred to as SymBots) using both proprietary and open-source technologies
- Orchestrated real-time debugging efforts of system components (software & hardware) in collaboration with a team of up to fifteen people in anticipation of and response to system errors

May 2023 – June 2023

Intern

UnifyAI Group, Inc. - Remote

- Implemented a portion of the user interface (designed to enable users working with Ivy's functional application programming interface (version 1.1.9) to execute specific operations using the PArallel Distributed Deep LEarning (PaddlePaddle) framework's original implementation of them by leveraging wrapper functions that are defined in the "backends" directory of the Ivy codebase) of

- Bash, C/C++, Rust, Python, & JavaScript/TypeScript
- MySQL, PostgreSQL, & MongoDB
- Git, GitHub Actions, Docker, & Kubernetes
- Various CLI utilities
- Multiple IDEs (i.e., Visual Studio, Atom, PyCharm, WebStorm, CLion, & Code::Blocks
- Unix-like OS & Windows
- x86_64, AArch64, & MIPS64
- PuTTY & Cygwin
- Qlik Sense
- LibreOffice & Microsoft 365

the Python (3.11.4) package using the corporation's chosen standard of code design

- Implemented a unit test for an instance method that enables a user to calculate the hyperbolic cosine of the elements contained within an array (the data structure (i.e., that dubbed an "_ivy_array") was implemented by previous contributors to the project)
- Exploited the continuous integration and continuous delivery platform (i.e., GitHub Actions) integrated into GitHub in order to automatically build the codebase and run tests (via workflows that were defined by previous contributors to the project) on my version
- Successfully merged my local branch into the corporation's public, master branch

May 2018 – August 2018

General Merchandise Expert

Target Corporation - New Braunfels, TX

- Fostered a guest-first culture across the store by providing exceptional customer experiences
- Managed the location's physical inventory
- Taught new associates the corporation's standard of practice for cashiering, stocking, and interpersonal interaction with customers

Noteworthy Projects

October 2026

An agentic, multi-agent coding system

github.com/lucasthormann/local-coder

- Written on my current workstation (i.e., a Lenovo T14 Gen 6 ThinkPad running Ubuntu (24.04.3) using the x86_64 instruction set)
- I wrote the application in Python (3.12.3)
- The system leverages four seperate large langauge models, each used for a specialized purpose
- From there, I deployed the application onto my personal production server (i.e., a five-node Kubernetes cluster (AArch64) using a Docker image
- Once my application was deployed, I was able to access the GUI (using a computer connected to and using my personal virtual private network server to tunnel into my LAN from an external network) via a domain name when it is entered into a modern web browser's address bar (i.e., I have a coding assistant anywhere I go!)

July 2026

A full-stack RAG chatbot

github.com/lucasthormann/lite-bot

- Written on my current workstation (i.e., a Lenovo T14 Gen 6 ThinkPad running Ubuntu (24.04.3) using the x86_64 instruction set)

- I wrote the backend of the application in Python (3.12.3) and the frontend in TypeScript (7.0.2)
- I deployed the application onto a proprietary cloud (partially composed of standard server CPUs (x86_64)) as a web service using the Render CLI (2.0.0)
- I monitor the deployment using a browser-based GUI referred to as a “Hobby workspace” provided by the Render platform
- Render’s cloud is built on top of popular hyperscaler platforms (e.g., Amazon Web Services). Thus, my application is essentially running on an abstraction of an Amazon Elastic Compute Cloud instance
- To run this bot locally, you must have Ollama and the appropriate models installed

December 2022

A compiler for a C-like language

github.com/lucasthormann/minimal-c-compiler.git

- Written within a virtual machine (VirtualBox (6.1.34)) running Red Hat Enterprise Linux (9.0)
- Primarily written in C (C17), though the code used to generate the lexical analyzer and parser was not
- Produces output in the form of a file containing Microprocessor without Interlocked Pipelined Stages assembly code
- The generated file can then be converted into platform-specific machine code using a dedicated assembler
- The assembled executable can then be run within an environment that simulates a 64-bit CPU which integrates the MIPS64 instruction set
- The aforementioned assembler and simulated environment are features of the Mips Assembly and Runtime Simulator that was created by Kenneth Vollmar and Pete Sanderson
